

HSBC Global Investment Funds

GLOBAL EMERGING MARKETS BOND

Monthly report 31 March 2023 | Share class AD

Investment objective

The Fund aims to provide long term capital growth and income by investing in a portfolio of emerging market bonds.

Investment strategy

The Fund is actively managed. In normal market conditions, the Fund will mostly invest its assets in investment grade and non-investment grade bonds issued by governments, government-related entities, supranational entities and companies based in emerging markets. The Fund may invest up to 30% of its assets in securities issued by a single government issuer with a non-investment grade credit rating. The Fund may invest up to 10% of its assets in onshore Chinese bonds which are issued within the People's Republic of China and traded on the China Interbank Bond Market. The Fund may invest up to 10% in convertible bonds. The Fund may also invest up to 10% of its assets in contingent convertible securities. The Fund may invest up to 10% of its assets in total return swaps and up to 10% in other funds. The Fund's primary currency exposure is to US dollars. See the Prospectus for a full description of the investment objectives.

Main risks

- The Fund's unit value can go up as well as down, and any capital invested in the Fund may be at risk.
- The Fund invests in bonds whose value generally falls when interest rates rise. This risk is typically greater the longer the maturity of a bond investment and the higher its credit quality. The issuers of certain bonds, could become unwilling or unable to make payments on their bonds and default. Bonds that are in default may become hard to sell or worthless.
- The Fund may invest in Emerging Markets, these markets are less established, and often more volatile, than developed markets and involve higher risks, particularly market, liquidity and currency risks.

Monthly performance commentary

Market review

Volatility hit the markets in March as a few US regional banks failed, in addition to take over of Credit Suisse by rival UBS. Emerging markets assets posted positive performance as they benefitted from a drop in rates and a weaker US dollar, as the market began to price in a sooner than expected end to monetary tightening in the US. March was marked by a potential banking crisis as SVB had a run-on deposit spreading fear amongst US regional banks. This prompted the failure of a few banks in the US, while Credit Suisse found itself in trouble, leading to a takeover by rival UBS. Markets began to worry as treasury yields fell, with the potential for the Fed to halt rates to contain the situation. However, with the backstops put in place by the Fed and US government, the Fed ultimately raised interest rates by 25bps. The market now believes this could be nearing the end of the tightening cycle and has priced in rates cuts. For EM central banks, those still fighting high inflation should continue to hike interest rates. EM spreads widened during the month while hard currency and corporate supply was negative. Finally, we saw outflows from the asset class during the month, mainly coming from hard currency retail funds. Over the month, the EMD asset classes experienced the following returns:

- Hard currency sovereign bonds returned: +0.96% (JP Morgan EMBI Global Diversified) - Investment Grade: +2.27%; High Yield: -0.40%
- Hard currency sovereign bonds ESG returned: +1.28% (JP Morgan ESG EMBI Global Diversified)
- Hard currency corporate bonds returned: +0.83% (JP Morgan CEMBI Broad Diversified)
- Hard currency corporate bonds ESG returned: +0.79% (JP Morgan ESG CEMBI Broad Diversified)
- Local bonds returned: +4.12 % (JP Morgan GBI-EM Global Diversified)
- Local bonds ESG returned: +4.33% (JP Morgan ESG GBI-EM Global Diversified)
- Local currencies returned: +2.05% (JP Morgan ELM+)

Performance and Positioning

EM hard currency assets posted positive returns in March as banking stress in the market led to a fall in US Treasury yields. The fund outperformed the benchmark during the month. During the month, select overweights to countries in the GCC region added to relative returns. In addition, the underweight to Bolivia and Egypt added to relative performance as they were amongst the worst performers on the month. Lastly, the overweight to duration added to relative performance as UST yield fell given the banking sector stress. In terms of detractors, the overweight to the quasi-sovereign in Mexico, Pemex, hurt relative returns over the period as it underperformed during the risk-on month. Additionally, off-benchmark exposure to corporates hurt relative performance. We ended the month with a neutral beta and covered some high-quality IG credits in the portfolio. In addition, we have added a relative value trade by increasing exposure to single B credits relative to BB credits as the valuation gap became excessive. We moved to an overweight duration position of 0.14 years relative to the benchmark, while maintaining an underweight to spread duration of -0.75 years. Lastly, we added some off-benchmark exposure to local rates.

Outlook

The rapid pace of central bank rate hikes finally caught up with the banking sector in March, with mark-to-market losses on capital triggering a regional banking crisis in the US and a string of bank failures most notably Silicon Valley Bank, and in Europe a liquidity crunch bringing down Credit Suisse and an SNB-facilitated acquisition by rival UBS. The market reaction to these events was a sharp rally in risk-free assets as investors flocked to safety, as well as wider credit spreads especially among bank and subordinated debt across EM. The Federal Reserve responded with two emergency liquidity programs as well as a more dovish stance at its meeting and a reduction in the US GDP forecast. Our view is that the banking sector risks while clearly now systemic will not cause contagion into EM bonds. For a variety of reasons, we see EM credit as immune from the events in the US and Europe. Firstly, EM banks tend to be more profitable and have greater buffers than banks in the US and Europe; and they typically have much larger market share in the geographies where they operate as EM banking systems are more concentrated, so less opportunity exists for deposit-switching behaviour. EM banks are used to volatile environments, specifically sharp interest rate cycles and FX fluctuations, and therefore carry higher capital buffers and hedges as a result. EM banks use AT1 issuance for different purposes – in some cases to lower the cost of funding across the capital structure, and often with greater government support and different regulatory intervention triggers, so AT1 bail-in recourse is much less likely. In short, we see the sell-off in EM credit as a general opportunity to add exposures, although we are limiting our overall exposure to banks and specific issuer concentrations in subordinated debt. The most likely path forward is that major central banks will pause their rate hikes as they assess the banking sector fallout, allowing a reprieve to EM assets and a reallocation globally into fixed income. In fact, we are optimistic that the Federal Reserve's greater focus on financial stability over inflation going forward may accelerate our view for EMFX appreciation this year, as the peak in interest rates is now likely behind us and the cycle of a strong US dollar with it. China's reopening should provide a major tailwind to EM economies this year, and we believe we are only in the very first inning of a cyclical recovery in global trade and financial flows to EM economies spurred by the Chinese engine. For 2023 as a whole and especially later in the year as the US economy slowdown is absorbed, we expect EM credit spreads to tighten, contributing to a forecast of double-digit returns at the index level. In March we added to investment grade credit exposures, topped-up our overall duration position to an overweight, and added EM currency positions to capture the market rotation from a changing Federal Reserve stance. We continue to like Latin American high quality US dollar bonds especially in quasi-sovereigns and corporates, China reopening trades in Asia, and select EM local duration positions in Brazil and South Africa. The greatest risk to our exposures would be another inflation shock, caused potentially by geopolitics, sending interest rates higher, causing another wave of US dollar buying, and calling systemic creditworthiness of EM issuers into question. We maintain tail risk hedge positions against this scenario.

The stocks mentioned are for illustrative purposes only and are not investment advice, investments have risks.

Risk Disclosure

- Derivatives may be used by the Fund, and these can behave unexpectedly. The pricing and volatility of many derivatives may diverge from strictly reflecting the pricing or volatility of their underlying reference(s), instrument or asset.
- Investment Leverage occurs when the economic exposure is greater than the amount invested, such as when derivatives are used. A Fund that employs leverage may experience greater gains and/or losses due to the amplification effect from a movement in the price of the reference source.
- Investment involves risk. Past performance figures shown are not indicative of future performance. Investors should read the prospectus (including the risk warnings) and the product highlights sheets, before investing. Daily price change percentage is based on bid-bid price.

Supplemental information sheet

Share class	Share Class Base Currency	Distribution Frequency	Dividend ex-date	Last Paid Dividend	Annualised Yield based on ex-dividend date
AC	USD	--	--	--	--
AD	USD	Annually	6 July 2022	0.705439	3.51%
AM2	USD	Monthly	29 March 2023	0.097348	8.56%
AM3HAUD	AUD	Monthly	29 March 2023	0.028357	7.05%
AM3HEUR	EUR	Monthly	29 March 2023	0.023926	6.07%
AM3HSGD	SGD	Monthly	29 March 2023	0.029116	7.23%
PD	USD	Annually	6 July 2022	0.505912	3.86%

The above table cites the last dividend paid within the last 12 months only.

Dividend is not guaranteed and may be paid out of capital, which will result in capital erosion and reduction in net asset value. A positive distribution yield does not imply a positive return. Past distribution yields and payments do not represent future distribution yields and payments. Historical payments may comprise of distributed income, capital, or both.

The calculation method of annualised yield prior to August 2019 is the simple yield calculation: (dividend amount / NAV per share or units as of ex-dividend date) x n; The calculation method of annualised yield from August 2019 is the compound yield calculation: $((1 + (\text{dividend amount} / \text{ex-dividend NAV}))^n) - 1$, n depends on the distributing frequency. Annually distribution is 1; semi-annually distribution is 2; quarterly distribution is 4; monthly distribution is 12.

The annualised dividend yield is calculated based on the dividend distribution on the relevant date with dividend reinvested, and may be higher or lower than the actual annual dividend yield.

Investors and potential investors should refer to the details on dividend distributions of the Fund, which are available on HSBC Asset Management (Singapore) Limited website.

Different classes may have different performances, dividend yields and expense ratios. For hedged classes, the effects of hedging will be reflected in the net asset values of such classes. Expenses arising from hedging transactions may be significant and will be borne by the relevant hedged classes. Hedged class performs the required hedging on a best efforts basis.
